

Defeasible identity constraints in TDL

Proposal: YADU backwards and forwards

Guy Emerson

YADU

- Lascarides and Copestake (1999)
<https://aclanthology.org/J99-1002>
- Combining strict and defeasible constraints (DefFS)
- Priority for defeasible constraints

YADU

- Lascarides and Copestake (1999)
<https://aclanthology.org/J99-1002>
- Combining strict and defeasible constraints (DefFS)
- Priority for defeasible constraints

YADU

- Credulous default unification (Carpenter, 1993):
 - Add as many default constraints as possible (there may be more than one result)

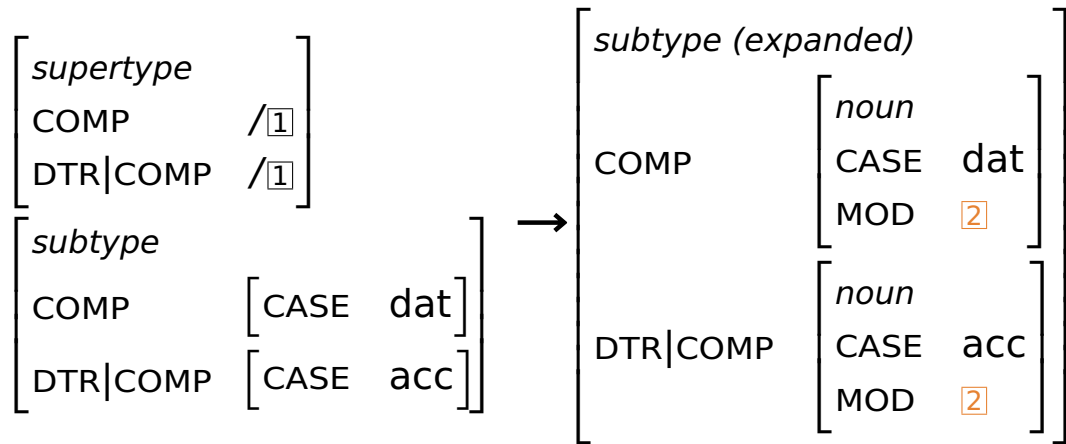

YADU

- Credulous default unification (Carpenter, 1993):
 - Add as many default constraints as possible (there may be more than one result)
- YADU (Lascarides and Copestake, 1999):
 - Find generalisation of credulous default unification (giving one result)

Problem Statement

$$\begin{bmatrix} \textit{supertype} \\ \text{COMP} \quad / \boxed{1} \\ \text{DTR} | \text{COMP} \quad / \boxed{1} \end{bmatrix}$$
$$\begin{bmatrix} \textit{subtype} \\ \text{COMP} \quad \begin{bmatrix} \text{CASE} & \text{dat} \end{bmatrix} \\ \text{DTR} | \text{COMP} \quad \begin{bmatrix} \text{CASE} & \text{acc} \end{bmatrix} \end{bmatrix}$$

Problem Statement

Applying YADU

- Credulous default unification discards the identity constraint (it is incompatible)

Applying YADU

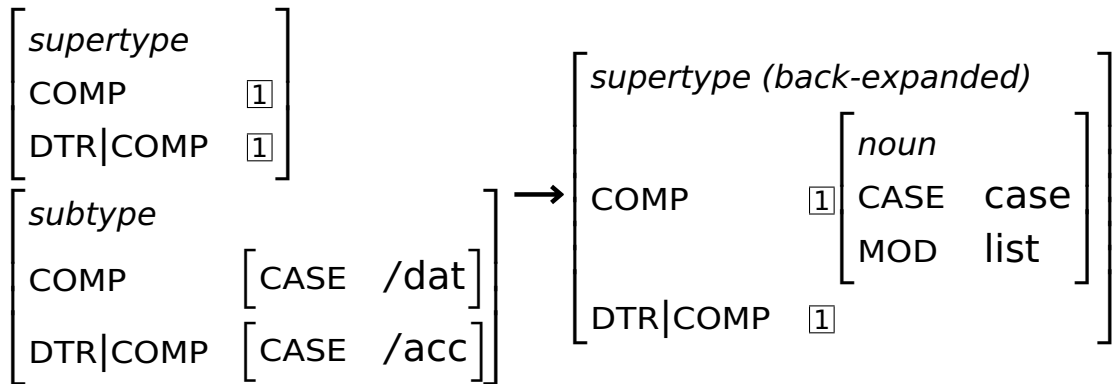

- Credulous default unification discards the identity constraint (it is incompatible)
- The “pushed down” identity combines something more specific and something less specific:
 - Existence of new feature path: more specific
 - Identity constraint on new path: less specific

Applying YADU “backwards”

<i>supertype</i>	
COMP	1
DTR COMP	1

<i>subtype</i>			
COMP	<table><tr><td>CASE</td><td>/dat</td></tr></table>	CASE	/dat
CASE	/dat		
DTR COMP	<table><tr><td>CASE</td><td>/acc</td></tr></table>	CASE	/acc
CASE	/acc		

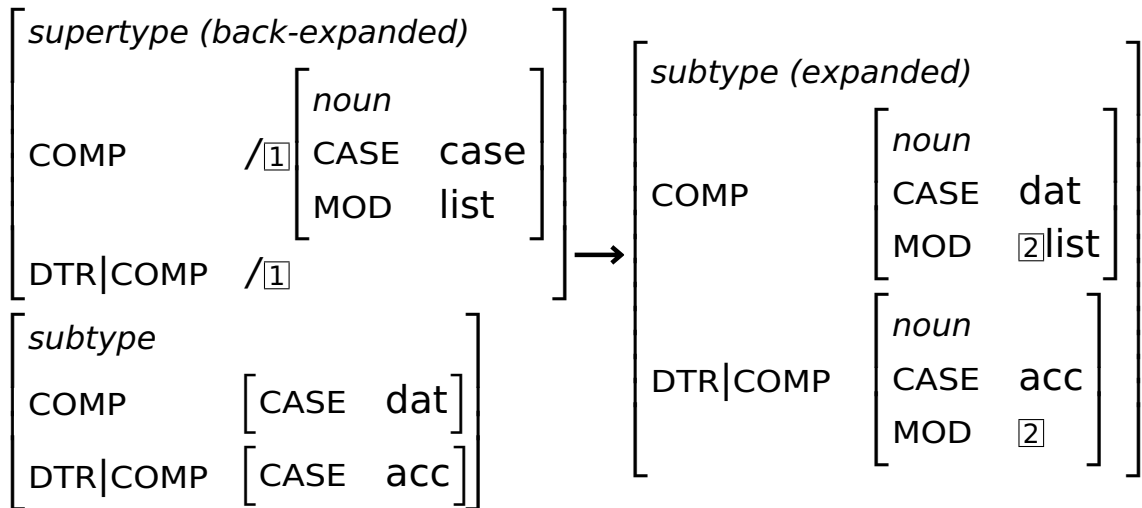

Applying YADU “backwards”

... then YADU “forwards”

<i>supertype (back-expanded)</i>			
COMP	/[1]	<i>noun</i>	
		CASE	case
		MOD	list
DTR COMP	/[1]		
<i>subtype</i>			
COMP		CASE	dat
DTR COMP		CASE	acc

... then YADU “forwards”

Summary

- Proposal: YADU applied backwards, then forwards (YADUDAY? or UDAYADU?)
- Allows defeasible identity constraints to be expanded, without a completely new mechanism
- All features need to be expanded when rules are defined (unification during parsing is too late)
